No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Description

This sequence has been recovered from the left border of the T-DNA.

It indicates an insertion close to or within gene At1g03160.

It indicates an insertion close to or within gene At1g03160.

Details on the protocols used for generation of the sequence are described in References 1-3. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project.

GABI-Kat is part of the German Plant Genomics program designated 'GABI-Kat in mpiz-Koeln.mpg.de/GABI-Kat/.

/note="Weetor: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources /documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pwD42 (gi|4732114|gb|RR129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

This sequence has been recovered from the left border of the T-DNA.

It indicates an insertion within the locus defined by BAC clone

FSD14. Details on the protocols used for generation of the sequence

are described in References 1-3. The sequences are generated at the

MPI for Plant Breeding Research in the context of the GABI-Kat

project. GABI-Kat is part of the German Plant Genomics program

designated 'GABI'. Information on line availability can be found

at: http://www.mpiz-koeln.mpg.de/GABI-Kat/.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /Gootype="Col.0"
/note="POC was performed on DNA from Arabidopsis thaliana plants (TI) which were transformed with the T-DNA from vector pAC16 (GenBank accession number: AJ537514). The lines contain one or more T-DNA inscrtions. The DNA fragment (s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the inscrtion. T-DNA derived sequences were removed."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Rosso,M.G., Li,Y., Strizhov,N., Reiss,B., Dekker,K. and Weisshaar,B.

// Lone lib="Soares mammary gland with a modified polylinker; lat strand cDNA was prepared from mammary gland tissue from a lactating female, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), disested with Not I and cloned into the Not I and Eco RI sites of the modified pT713 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CL844510

EX12606-5prime Drosophila melanogaster P{EPgy2} P element insertion lines Drosophila melanogaster genomic Sequence recovered from 5' end of P element, genomic survey sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (http://www.jax.org/resources/
(http://www.jax.org/resources/
was hydrodynamically sheared by repeated passage through a
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pwafe2 (gil 4732114|gblAF129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli Xiii0-Gold (Stratagene) cells
and selected for ampicillin resistance."

/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/G1 (male) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/dnares/). The DNA
was bydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically shader or oligonuclectides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4732114|gpl|AP129072.1), a copy-number
inducible derivative of plasmid RI. The vector was ligated
with adaptors complamentary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli Xill0-Gold (Stratagene) cells
and selected for ampicillin resistance."

For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu.' Grid S was grown at San Diego in 2002. DNA was extracted from leaf strips, double digested using BamH1 and BglII; and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with ampicillin."

from contaminating host leukocytes by filtration of ADP activated blood through acid-washed glass beads and Whatman CF11 cellulose columns by gravity filtration. Purified DNA was digested with mung bean nuclease in the presence of 42.5% formanide at 500C as described (Galinski, M. et al. 1992. Cell 69,1213-1226, Vernick, K.D. et al. 1988. N.A.R. 16, 6883-6896). Eco RI linkers were added and the constructs ligated into Lambda ZAP II. P. vivax Belem was originally isolated from a patient in Belem, Brzzil 1980 by Mercia de Arruda, adapted to Saimiri monkeys by Jurg Gysin, and maintained since 1983 in squirrel monkeys."

/dlone lib="Exelixis P element XP (GenBank accession number / note="wector: P element XP (GenBank accession number / NYS15149); An isogenic w- Drosophila melanogaster strain was mutagenized by remobilization of transposable elements. For the P element XP, we selected an easily mobilized ammunition element among inserts hopped onto the Binsinscy balancer. New insertions were collected in vials from dysgenic females using the standard chromosomal source of transposase, delta2-3. All lines were mapped to a chromosome by standard genetic methods, examined for homozygous viability and used for recovery of flanking genomic sequence by inverse PCR."

/clone lib="Wouse 10kb plasmid UUGCIM library"
/noce="Vector: PWD42IV; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifica at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated by marses and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pwD42 (gi|4732114|gb|AF12972.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adapprored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gal electrophoresis. Vector DNA was prepared from a derivative of pwalpa? (gil #712114 [gpl AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             BH855497 linear GSS 08-JUL-2002 SALK 085040.16.20.x Arabidopsis thaliana TDNA insertion lines Arabidopsis thaliana genomic clone SALK_085040.16.20.x, genomic

/note="Organ: leaf; Vector: RescueMu (engineered from pBlueScript backbone); Site I: BamHI, Site 2: BglII;
RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.ramdb.isatate.edu' and follow the links for streacted from leaf punches, double digested using BamHI and BglII, and ligated to form circular plasmids.
DH10B cells were transformed and then screened on LB plates with ampicillin."

                     Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web salte www.zmdb.isstate.edu and follow the links for 'RescueMu', Grid I was grown at Berkeley in 2001. DNA was extracted from leaf punches, double digested using BamHI and Bgill, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with ampicillin."

The piggyBac insertion position is 1 in the 49 bases. This insertion position refers to the first base of the 4 base TTAA target recognition sequence.
Class: transposon insertion site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Contact: Roger A Hoskins

transposase expression by immersing bottles in a circulating 370C water bath for a daily (days 3-10 after egg-laying) 1-h heat shock. We outcrossed the resulting dysgenic males to an isogenic w- strain. New insertions were identified on the basis of a change in eye color (third chromosome ammunition) or the appearance of w+ male progeny (X chromosome ammunition). All lines were mapped to a chromosome by standard genetic methods, examined for homozygous viability, and used for recovery of flanking genomic sequence by inverse PCR."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      36 bp mRNA linear EST 05-FEB-1998 zj50hi0.sl Soares fetal liver spleen lNFLS S1 Homo sapiens CDNA clone IMAGE:453763 3' sīmilar to gb [L28107] TRRRRH Trichoderma reesei 25S ribosomal (rRNA);, mRNA sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting predisposition to high altitude pulmonary edema (HAPE) by amplifying intron 7 of human inducible nitric oxide synthase gene, and predicting and analyzing differences in the distribution of allelic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel method for detecting predisposition thigh altitude pulmonary edema (HAPE). The method comprises amplifying intron 7 of the human inducible nitric oxide synthase (iNOS) gene (ADZ75764) by designing and synthasizing forward and reverse oligonucleotide primers (ADZ75765), and predicting and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human inducible nitric oxide synthase gene exon 7 reverse PCR primer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to new rodent beta-actin and ribosomal protein S21 (rpS21) promoters that have a low level of sequence homology to protein S21 (rpS21) promoters that have a low level of sequence homology to protein S21 (rpS21) promoters that invention is based on the discovery that beta-actin promoters have higher promoter activity, and the discovery that the hamster rpS21 promoter is at least as active as the hamster Beta-actin promoter when used for expressing centain genes. The nucleotide sequences are useful as probes for screening genomic libraries for isolation of genomic sequences that hybridize to one or more of the promoter sequences or their variants. The promoters are useful as enhancers and respressors, and in a vector for expression of heterologous nucleic acids encoding therapeutic proteins, such as alpha-glucosidase, acid sphingomyelinase, insulin, erythropoietin, glucocerebrosidase, alpha-galactosidase and various antibodáes. The present sequence is a forward primer for PCR detection of the chinese hamster beta-actin promoter containing intron 1.
                                                                                                                                                         ö
statistically analyzing differences in the distribution of the allelic variants in the populations, where GG genotype at 19480 position are at low risk of HAPE, and AA genotype at 19480 position are at hAPE. The present sequence represents the forward oligonucleotide primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New beta-actin and ribosomal protein S21 (rpS21) promoters, useful as enhancers and repressors for expression of heterologous nucleic acids encoding therapeutic proteins such as approximatelya-glucosidase, antibodies, and insulin.

Human diacylglycerol kinase-zeta intron 22/exon 23 junction sequence.

(first entry)

31-JUL-2001

AAD05966;

AAD05966 standard; DNA; 20 BP.

```
The present sequence corresponds to nucleotides 611-629 of the coding sequence of the livin (inhibitor of apoptosis protein) gene. Use of a nucleic acid containing this sequence, or its fragment of derivative, to prepare siRNA which sensities therapy-resistant tumour calls for a poptosis is claimed. The siRNA is preferably delivered into a therapy-resistant tumour calls for using liposomes or hydrodynamic injection. The siRNA will be present sequence joined, via a linker, to a complementary DNA strand. This is also used to prepare siRNA which sensities therapy-resistant tumour cells for apoptosis, and is inserted into an expression vector with a cytostatic compound, death receptor ligand, death receptor into an expression vector with a cytostatic compound, death receptor ligand, death receptor into an expression vector with a cytostatic compound, death receptor ligand, death receptor into an expression vector anchor in sentiobdy or negative regulator of anni-appoince proteins. The therapy are sistant tumour is neuroblastoma, intestinal carcinoma preferably colon, familiary adenomatous polyposis, hereditary non-polyposis colorectal. Oesophagasi, labial, laryngeal, hypopharynx, salivary and colorectal acarcinoma, medullary thyroid carcinoma, senior and preference carcinoma, service arcinoma, serviced carcinoma, serviced carcinoma, serviced carcinoma, becast carcinoma, serviced carcinoma, becast carcinoma, astrocycoma, menance carcinoma, nearonoma, panceatic carcinoma, medullary deponential carcinoma cervice preferably glioblascoma, astrocycoma, meningioma, medullary continuar carcinoma, service may use partice may all pladder carcinoma, uterine carcinoma, medullary continuary carcinoma, melanoma, burkitt's lymphoma, acute lymphatic leukaemia (CML), acute myeloid leukaemia (AML), chronic carcinoma, pania parenchyma, multiple myelond, paperocalmy sensitiona, cervical carcinoma, bronchial carcinoma, sellongarioma, carcinoma, pania sarcinoma, bronchial carcinoma, sellongarioma, choroidea melanoma, melanoma, labader c
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Use of a nucleic acid, or its fragment or derivative, for preparing Livin -specific siRNAs as an apoptosis inhibitor for the treatment of therapy-

Human diacylglycerol kinase DNA is useful for coding human diacylglycerol kinase, which is useful for catalysing the conversion of diacylglycerol to phosphatidic acid. In particular, the human diacylglycerol kinase and its DNA are useful for decreasing intracellular levels of diacylglycerol [DAG) and for increasing intracellular levels of diacylglycerol glycerol (DAG) and for increasing intracellular levels of phosphatidic acid in cells. The present DNA sequence is the exon/intron junction sequence of human diacylglycerol kinase (DGK) zeta gene
                                                                                                  Human; catalyst; diacylglycerol; DAG; phosphatidic acid; DAG modulator; diacylglycerol kinase zeta; DGK; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New DNAs of the human diacylglycerol kinase, useful for modulating the levels of diacylglycerol kinase in cells to catalyze the conversion of diacylglycerol to phosphatidic acid, therefore increasing phosphatidic acid levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The patent discloses novel human diacylglycerol kinase (DGK) isoforms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;
